

PTV Intertour/Cargo is the right tool for calculating your freight costs, even for different tariffs, margins and special conditions. In this way you are always informed about the costs for each trip and it becomes easier for you to decide which order should be assigned to which forwarder.

Your task

You are a loader and use both your internal fleet and sometimes the services from one or more freight forwarders to solve your transport tasks. Or you are a forwarder and cooperate with various sub-contractors. Maybe you even have different tariff rates, margins or special conditions for each freight forwarder.

You have to calculate the freight costs for your transport services for which you have to generate credit notes. The decision as to which trips are driven with your internal fleet and which are assigned to forwarders is not easy. You do not only need to know which trip should be driven with your fleet, you also need to know which trip can be assigned to which forwarder at the lowest costs.

Invoicing freight costs

Our solution:

With PTV Intertour/Cargo you manage your forwarders' key data as well as individual tariffs, margins and special conditions such as:

- ▶ Special prices for trips to a certain postal code area
- ▶ Star-shaped invoices with main run to stop with maximal weight
- ▶ Source-destination tariffs
- ▶ Freight matrix with any kind of scaling
- ▶ BSL customer rate, GPT, KURT

PTV Intertour transfers the scheduled trips to the software which firstly calculates the costs for the first trip with forwarder A, B, C or with the own vehicle. All trips are calculated in this way.

The result

The best forwarder for a trip or several trips is automatically indicated. Moreover, the trip list presents all possible forwarders sorted according to costs. The calculation takes the best freight tariff for each forwarder into account.

The trip list indicates in columns the total costs, demurrage charges, freight rates, comparison and assignment (yes/no) for each trip. It is also possible to manually assign the trip to a specific forwarder, even if it deviates from the suggested solution.

Functions performed by the add-on module PTV Intertour/Cargo:

- ▶ Management of tariffs, margins and special conditions
- ▶ Freight calculation on trip level while planning the trip
- ▶ Selection of the most favourable provider of transport services
- ▶ Support of decision-making activities by analysing trip costs for deliveries with external forwarders or internal fleet
- ▶ Interface for transferring billing data to third-party systems, for example to CARGO, the complete software suite for invoicing and generating credit notes, account assignment, posting and freight simulation
